

Test Beam Pixel Visualization

Evan Chang

ATLAS Experiment

- Experiment being done at the Large Hadron Collider at CERN
- Studies involve the standard model, fundamental particles

Purpose

- Inner detector at CERN will be replaced in 2024
 - Old detector was made with pixels, strips, gaseous tracker
 - Will be replaced with all silicon tracker
 - The pixel detector hardware must be tested
 - New technologies like CMOS pixels

Generated by
Andrew Fischer

Pixel Detectors

- How they work
 - Electric field in place within sensor
 - Particle comes through and scatters electrons
 - Electrons get picked up by one side of sensor
 - Signal gets sent across bump-bond and turned into electronic signal
 - CMOS pixels don't require a bump bond

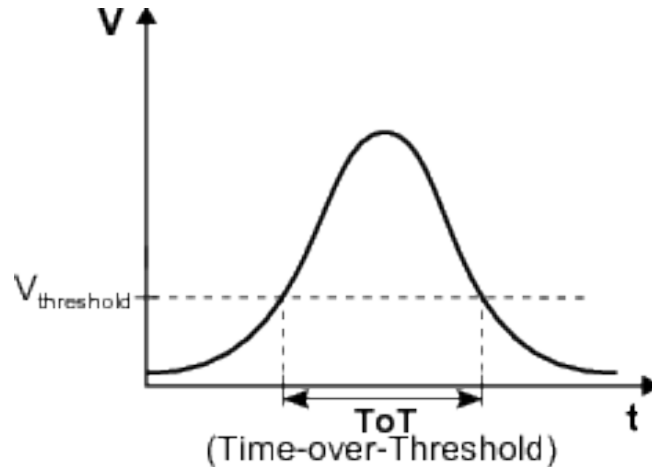

Test Beam

- We need to test the performance of the CMOS detectors
- Set up several sensors in a line to create a pixel telescope
 - Sent protons along track
 - Generated tracks from the hits

What is a hit?

- Raw data is given in timestamps, time-over-threshold, and pixels
- Events are determined by setting threshold gating and hit plane parameters
 - Gating is determined by the time-over-threshold
 - Number of planes that must register a hit

What is a track?

- The track is a representation of the proton's path through the telescope planes
 - Since beams are straight lines, track is determined by Chi^2
 - Track is given by x_0 , y_0 , and slope (x/z , y/z)
- Must have 2 trigger hits
 - First and last plane must record a hit
- Chi^2 must be lower than 5
 - This ensures that we aren't just looking at noise
- All 6 telescope planes must be hit

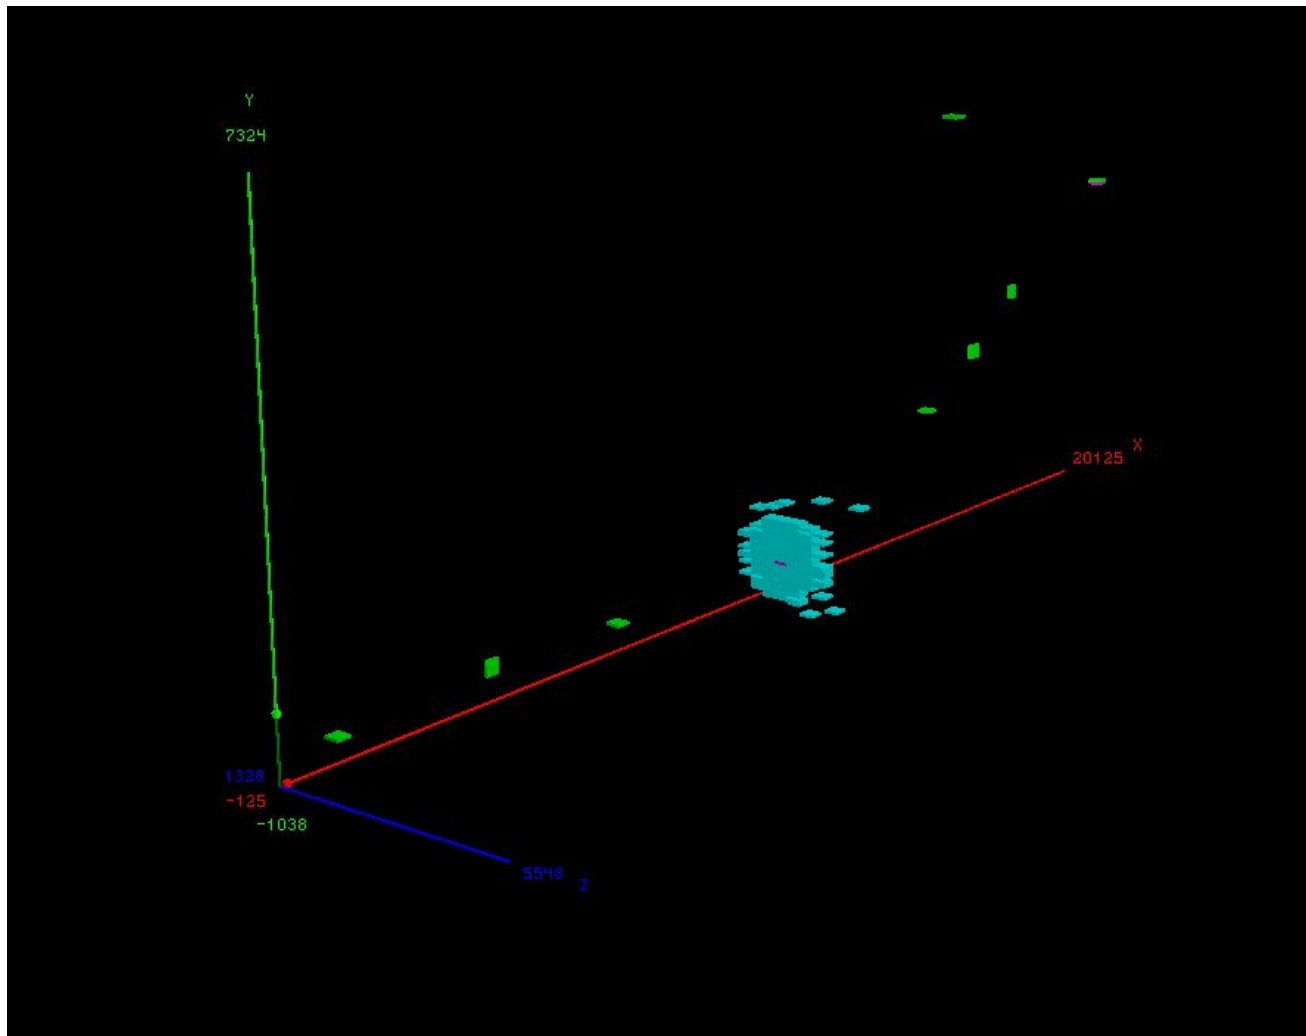

Visualization Program Developed

- Takes the sensor geometry and pixel data to create a 3D representation of an event
 - Can display entire event to scale or only the hit pixels, to get a better view
 - Aids in analysis

Only displaying the pixels

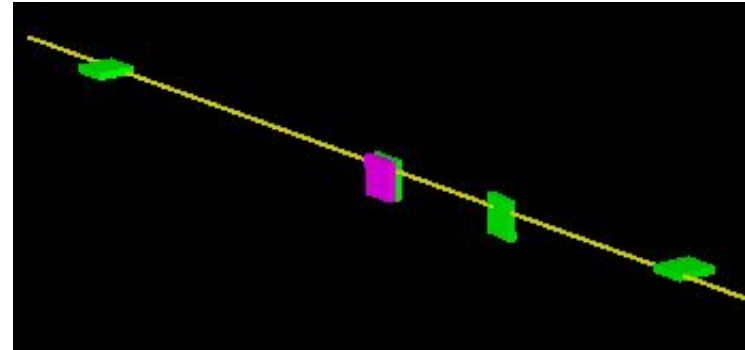

Errors Discovered

- Found a boolean that should've been a double
 - Not all distances should be 1
 - Easy to visually see that distances were not being calculated properly
- Track algorithm was biased
 - Putting tracks in a larger grid than expected
- Clustering algorithm was biased
 - Absolute value was missing from cluster-track distances
 - Clusters would be placed inaccurately on one side of the track
